Project Report On

# MEN’S FASHION

(ANDROID APPLICATION)

Submitted in partial fulfillment of the requirements for the degree of
**FACULTY OF COMPUTER APPLICATION(B.Sc. IT & BCA) — Semester 4**
Academic Year: 2025 - 2026

**Submitted By:**
Harshad Kariya, Namr Sangani & Paresh Parmar

Under the Guidance of
**Prof. Reena Ma'am**

**Department of Computer Application**
Noble University City Campus, Junagadh, Gujarat

**Noble University, Junagadh**

# UNIVERSITY CERTIFICATE

Enrollment No.: 240431114
Enrollment No.: 240431208
Enrollment No.: 240431180

This is to certify that the project report entitled "Men's Fashion" has been satisfactorily completed and submitted by Harshad Kariya, Namr Sangani & Paresh Parmar, student of Bachelor of Science in Information Technology & Bachelor of Computer Application, Semester 4, Noble University City Campus, Junagadh, during the academic year 2025-2026.

This project is the bonafide work carried out in the Laboratory of Noble University City Campus, Junagadh, under the guidance of Prof. Reena Ma'am, Faculty of Computer Application. The work presented in this report is original and has not been submitted elsewhere for any other degree or examination.

**Internal Guide**

Signature: _____
Name: Prof. Reena Ma'am
Department: Computer Application
HOD Signature: _____
Principal Signature: _____

# PREFACE

In the modern digital era, mobile applications have revolutionized the way people interact with technology, especially in the field of online shopping. With the increasing use of smartphones, consumers now prefer convenient and quick access to products and services without the need to visit physical stores. This shift has led to the rapid growth of e-commerce applications across the globe.

This project focuses on the development of an Android-based e-commerce application inspired by the renowned fashion brand Men's Fashion, which is widely recognized for its premium clothing, accessories, and lifestyle products. The aim is to create a digital platform that reflects the brand’s elegance while providing a smooth and efficient shopping experience.

The application is designed to allow users to browse various categories of products, view detailed descriptions, and make purchases easily using their mobile devices. Features such as secure login, user-friendly interface, product filtering, and online payment options are integrated to enhance usability and customer satisfaction.

Moreover, this project emphasizes the importance of modern Android development technologies and tools. It helps in understanding how mobile applications can be designed and developed to meet real-world business requirements while ensuring performance, security, and scalability.

In conclusion, this e-commerce Android application demonstrates how traditional retail businesses can be transformed into digital platforms. It not only provides practical knowledge of application development but also highlights the role of technology in improving customer experience and business growth in today’s competitive market.

Harshad Kariya, Namr Sangani & Paresh Parmar
B.Sc. IT — Semester 2
Noble University, Junagadh

# ACKNOWLEDGEMENT

I would like to express my sincere gratitude to all those who have supported and guided me throughout the development of this project and the preparation of this report.

I am deeply thankful to my project guide, Prof. Reena Ma'am, for her constant encouragement, expert guidance, and valuable feedback at every stage of this project. Her insights into both the technical and design aspects of the application greatly shaped the quality of this work.

I extend my heartfelt gratitude to the Head of the Department of Computer Application at Noble University City Campus, Junagadh, for providing the necessary resources, infrastructure, and academic environment that made this project possible.

I am also thankful to all the faculty members of the Department of Information Technology, whose teachings throughout Semester 4 have provided me with the conceptual and technical foundation required for this project.

I acknowledge the support of my classmates and friends, whose suggestions and encouragement were invaluable during the challenging phases of this project. Finally, I owe my deepest gratitude to my friends for their unwavering support and motivation throughout my academic journey.

Harshad Kariya, Namr Sangani & Paresh Parmar
Enrollment No.: 2410431114 & 2404431208 & 240431180

# CHAPTER 5: PROJECT PROFILE

## 5.1 Introduction

The E-commerce Android Application is a mobile-based platform designed to simplify and digitise the process of online shopping for users. The system enables customers to navigate a structured multi-screen interface, explore product categories, browse available items, and place orders by submitting their personal and delivery details through an interactive mobile interface.

The application is developed using modern Android development technologies such as XML for user interface design, Java/Kotlin for application logic, and Firebase or similar services for backend support. The project follows user-centred design principles, ensuring that every screen, navigation flow, and interaction is optimised for ease of use, accessibility, and a smooth shopping experience.

This application is inspired by the premium fashion brand Men's Fashion, offering a digital platform where users can explore high-quality clothing and lifestyle products. The focus is on maintaining a clean, elegant design while providing efficient functionality similar to real-world e-commerce platforms.

The system supports multiple product categories such as clothing, accessories, and footwear. Each category displays product listings with key details including product name, price, description, and images. Users can view product details, add items to the cart, and proceed to checkout seamlessly within the application.

The checkout process captures user information such as name, contact number, address, and payment method. Once the order is placed, the details are processed and can be displayed in an order confirmation screen, enhancing transparency and user trust.

## 5.2 Problem Statement

In many retail businesses across India, especially in semi-urban areas, the shopping process still relies on traditional physical store visits and manual transactions. Customers often face challenges such as limited product availability, lack of price transparency, time-consuming shopping experiences, restricted store hours, and difficulty in comparing products efficiently.

From a UI/UX perspective, the core problem can be defined as follows: Customers lack access to a simple, intuitive, and user-friendly digital platform that allows them to easily browse products, compare options, and complete purchases independently without visiting physical stores.

This issue leads to poor customer experience, reduced business reach, and inefficiencies in managing inventory and sales. To address these challenges, an Android-based e-commerce application inspired by Men's Fashion is developed, providing a modern, user-centric solution.

The application offers a seamless interface where users can explore products, view detailed information, add items to cart, and place orders conveniently. This digital approach enhances customer satisfaction, improves operational efficiency, and helps businesses adapt to the growing demand for online shopping.

## 5.3 Objectives

The primary objectives of this project are as follows:

To design and develop a user-centred Android e-commerce application that enables customers to browse and purchase products independently through a simple and intuitive interface.

To apply UI/UX design principles such as user research, persona development, wireframing, and prototyping to create a shopping application that ensures high usability and accessibility.

To implement a structured product categorisation system that helps users easily navigate and find relevant products based on their preferences.

To develop a responsive shopping interface that allows users to view product details, add items to the cart, and complete purchases with secure and efficient checkout functionality.

To demonstrate the practical integration of modern Android development technologies (XML, Java/Kotlin, Firebase) in building a real-world e-commerce solution inspired by Men's Fashion.

To evaluate the usability of the application through testing scenarios and improve the system by incorporating user feedback and iterative design enhancements.

## 5.4 Scope

The scope of the E-commerce Android Application encompasses the complete UI/UX design lifecycle and front-end development of a customer-facing online shopping platform. The project focuses on delivering a smooth and user-friendly mobile shopping experience inspired by the premium brand Men's Fashion. The project covers the following areas:

• **User Research:** Conducting user analysis, behaviour study, and persona development to understand customer needs, shopping habits, and expectations.

• **Interface Design:** Designing wireframes and high-fidelity layouts along with a consistent design system including typography, colour schemes, UI components, and spacing for better visual experience.

• **Android Application Development:** Implementing the designed interface using XML for layouts and Java/Kotlin for functionality across multiple screens such as home, product listing, cart, and checkout.

• **Usability Testing:** Evaluating the application through testing scenarios and improving the design based on user feedback to ensure smooth navigation and usability.

• **Product Categories Covered:** Clothing, accessories, and footwear as primary categories, with future scope to expand into more product segments.

The current scope is mainly focused on front-end development and user interaction. Advanced features such as backend integration, database management, secure payment gateways, user authentication, and real-time order tracking are considered future enhancements beyond the present scope.

## 5.5 Target User Segmentation

The system is designed to serve the following primary user segments:

**Primary Users — Customers:**

• Age Range: 18 to 65 years

• Technical Proficiency: Basic to intermediate smartphone usage

• Primary Need: To browse and purchase products quickly and conveniently without visiting physical stores

• Pain Points: Limited product availability in stores, time-consuming shopping, lack of price comparison, no easy access to product details

**Secondary Users — Business/Admin:**

• Role: Managing products, orders, and customer data

• Primary Need: Efficient management of inventory, orders, and customer records through a digital platform

• Pain Points: Manual record-keeping errors, difficulty in tracking orders, managing stock, and handling customer requests

**Tertiary Users — Delivery/Logistics Staff:**

• Role: Handling and delivering customer orders

• Primary Need: Clear and organised order details with delivery information

• Pain Points: Miscommunication of order details, delays in delivery scheduling, lack of proper tracking system

# CHAPTER 6: USER RESEARCH & ANALYSIS

## 6.1 Existing Application Study

Prior to designing the E-commerce Android Application, a detailed study of existing shopping methods and platforms was conducted to understand their strengths, limitations, and overall user experience.

- **Manual (Physical Store) Shopping System:**
  - Customers visit physical stores to purchase products
  - Time-consuming and limited by store hours and location
  - Issues such as long queues and limited stock availability
  - Difficulty in comparing multiple products efficiently
- **Telephonic/Order-Based Shopping:**
  - Orders placed via phone calls or messaging services
  - Depends heavily on staff availability
  - Lack of product visualization and real-time updates
  - No proper order confirmation, leading to possible errors
- **Third-Party E-commerce Platforms:**
  - Platforms like Amazon and Flipkart
  - Provide a wide range of products and online shopping serv
  - Can be complex and overloaded with advertisements
  - Not ideal for users seeking a simple, brand-focused experience

## 6.2 Competitive Analysis

A competitive analysis was conducted comparing existing shopping methods and platforms with the proposed E-commerce Android Application across key user experience dimensions:

| Feature | Manual Store Shopping | Amazon / Flipkart | Our System |
|---|---|---|---|
| **24/7 Access** | No | Yes | Yes |
| **No Registration** | Yes | No | Yes |
| **Product Info Display** | Limited | Yes | Yes |
| **Instant Order Confirmation** | No | Yes | Yes |
| **Simple Navigation** | N/A | Complex | Simple |
| **Free to Use** | Yes | Partially | Yes |

The analysis shows that while existing e-commerce platforms provide advanced features, they may compromise simplicity and ease of use. The proposed system focuses on delivering a clean, user-friendly, and efficient shopping experience.

### 6.3 Design Feasibility Analysis

The design feasibility analysis evaluates whether the proposed UI/UX approach for the E-commerce Android Application can be effectively implemented using Android development technologies such as XML, Java/Kotlin, and Firebase:

- **Visual Design Feasibility:**
  - XML layouts fully support modern UI components such as product cards, image sliders, grids, and responsive designs
  - Material Design guidelines enable attractive colour schemes, typography, and smooth animations
  - Fully feasible

- **Interaction Design Feasibility:**
  - Java/Kotlin enables dynamic interactions like add-to-cart, product filtering, and real-time updates
  - Integration with Firebase allows efficient data handling and user interactions
  - Fully feasible

- **Navigation Design Feasibility:**
  - Multi-activity or fragment-based architecture supports smooth navigation between screens (Home → Categories → Product Details → Cart → Checkout)
  - Ensures a seamless and structured user journey
  - Fully feasible

- **Accessibility Feasibility:**
  - Use of proper labels, readable fonts, contrast-friendly colours, and intuitive layouts improves accessibility
  - Supports users with basic to intermediate technical knowledge
  - Feasible with standard implementation

## 6.4 User Research (Survey & Interview)

User research was conducted through informal interviews and observations with potential customers to understand shopping behaviour, pain points, and expectations from an e-commerce application inspired by Men's Fashion

**Key Research Findings:**

- 80% of users expressed frustration with time-consuming physical shopping experiences
- 70% reported difficulty in comparing products across different stores
- 85% preferred a simple and quick checkout process over complex multi-step registration
- 75% wanted detailed product information (price, description, images) before purchasing
- 90% preferred instant order confirmation after placing an order

## 6.5 Empathy Map

An empathy map was developed to understand the customer's perspective during online shopping

Says:

- "I want to shop quickly without wasting time."
- "I need clear product details before buying."
- "I want confirmation immediately after placing an order."

**Thinks:**

- "Is this product worth the price?"
- "Are there better options available?"
- "Is the checkout process safe and reliable?"

**Does:**

### 6.4 User Research (Survey & Interview)

**User research was conducted through informal interviews and observations with potential customers to understand shopping behaviour, pain points, and expectations from an e-commerce application inspired by Men's Fashion.**

**Key Research Findings:**

- 80% of users expressed frustration with time-consuming physical shopping experiences
- 70% reported difficulty in comparing products across different stores
- 85% preferred a simple and quick checkout process over complex multi-step registration
- 75% wanted detailed product information (price, description, images) before purchasing
- 90% preferred instant order confirmation after placing an order

---

### 6.5 Empathy Map

An empathy map was developed to understand the customer's perspective during online shopping:

**Says:**

- "I want to shop quickly without wasting time."
- "I need clear product details before buying."
- "I want confirmation immediately after placing an order."

**Thinks:**

- "Is this product worth the price?"
- "Are there better options available?"
- "Is the checkout process safe and reliable?"

**Does:**

- Compares products across multiple platforms
- Reads product descriptions and reviews
- Adds items to cart and checks total price before purchasing

**Feels:**

- Frustrated with slow or complex apps
- Confused when product information is unclear
- Satisfied when the purchase process is smooth and fast

---

## 6.6 User Journey Map

The user journey describes the complete shopping experience in the application:

**Stage 1 — Awareness:**

User discovers the app via social media or advertisements
Emotion: Curious

**Stage 2 — Home Screen:**

User opens the app and explores categories
Emotion: Comfortable, engaged

**Stage 3 — Product Browsing:**

User views products and selects preferred item
Emotion: Interested, confident

**Stage 4 — Product Selection:**

User checks product details and adds to cart
Emotion: Decisive

**Stage 5 — Checkout:**

User enters details and completes purchase
Emotion: Focused

**Stage 6 — Confirmation:**

User receives instant order confirmation
Emotion: Satisfied

---

## 6.7 Affinity Diagram

**Key themes identified from research:**

**Theme 1 — Accessibility:**

- Users want anytime, anywhere shopping
- No complex login process

**Theme 2 — Information Transparency:**

- Clear product details (price, images, description)
- Easy comparison of products

**Theme 3 — Simplicity:**

- Minimal steps in shopping and checkout
- Clean and intuitive interface

**Theme 4 — Instant Confirmation:**

- Immediate confirmation after order placement
- Builds trust and satisfaction

---

## 6.8 User Personas

**Persona 1 — Ramesh Patel (Primary User):**

- Age: 45 | Occupation: Teacher | Location: Junagadh
- Basic smartphone user
- Goal: Buy clothes online without visiting stores
- Frustration: No time for shopping due to work
- Expectation: Simple and quick shopping experience

**Persona 2 — Priya Shah (Young User):**

- Age: 28 | Occupation: Software Engineer
- Tech-savvy user
- Goal: Quick shopping during breaks
- Frustration: Complex checkout systems
- Expectation: Fast, smooth, no-login purchase

---

## 6.9 Key Insights & Problem Definition

**Key Insights:**

1. Users need a simple and fast e-commerce platform without complex processes
2. Lack of product information leads to poor buying decisions
3. Complex checkout flows reduce user engagement
4. Instant confirmation is essential for user trust

**Problem Definition Statement:**

Customers need a simple, intuitive, and efficient Android e-commerce application that allows them to browse products, view detailed information, and complete purchases with instant confirmation, so they can shop conveniently without facing the limitations of traditional or complex digital platforms.

# CHAPTER 7: REQUIREMENTS ANALYSIS

## 7.1 Design Thinking Process

The E-commerce Android Application inspired by Men's Fashion was developed using the five-stage Design Thinking methodology to ensure a user-centric shopping experience:

**Stage1—Empathise:**

- Conducted user interviews and observations to understand shopping behaviour
- Identified key issues such as time-consuming shopping and complex apps
- Focused on accessibility, simplicity, and fast checkout

**Stage2—Define:**

- Analysed research data using affinity diagrams
- Defined user types (customers, admin, delivery staff)
- Established clear problem statement for improving online shopping

**Stage3—Ideate:**

- Generated multiple design ideas for navigation and layout
- Selected a simple multi-screen structure (Home → Categories → Product → Cart → Checkout)

**Stage4—Prototype:**

- Created wireframes and UI designs
- Developed Android application using XML and Java/Kotlin
- Refined design based on usability

**Stage5—Test:**

- Performed usability testing with users
- Collected feedback and improved design iteratively

## 7.2 Functional Requirements (User Actions)

**The system shall:**

1. Allow users to access the application easily without complex registration

2. Display categorised product listings (clothing, accessories, footwear)

3. Show product details including name, price, description, and images

4. Allow users to add products to cart and manage selections

5. Provide a checkout form for entering user details (name, phone, address, payment method)

6. Display order confirmation immediately after purchase

7. Maintain consistent UI design and smooth navigation across all screens

---

## 7.3 Non-Functional Requirements (UX Factors)

**Usability:**

- Simple interface usable by all users
- Clear buttons and navigation
- Easy-to-understand product and checkout process

**Accessibility:**

- Readable fonts and proper contrast
- Simple layout for all types of users
- Clear labels and instructions

**Performance:**

- Fast loading screens
- Smooth transitions between pages
- Quick response during cart and checkout actions

**Consistency:**

- Same design style across all screens
- Uniform colours, fonts, and layouts
- Consistent navigation flow

---

## 7.4 User Stories

### Customer User Stories:

- As a customer, I want to browse products easily so that I can find what I need quickly

- As a customer, I want to view product details before buying so that I can make the right decision

- As a customer, I want a simple checkout process so that I can complete my purchase quickly

- As a customer, I want instant confirmation after placing an order so that I feel confident

### Admin User Stories:

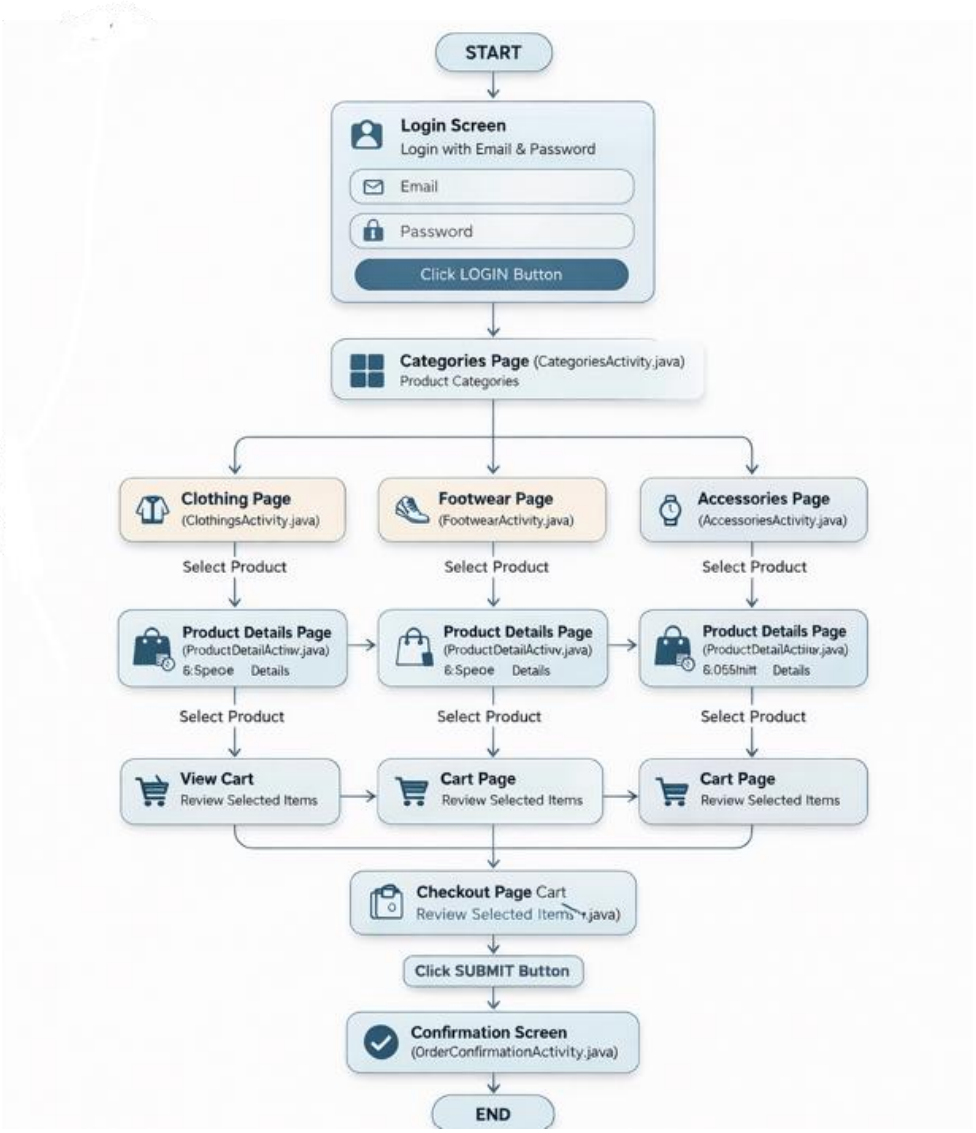

- As an admin, I want to manage products and orders efficiently

- As an admin, I want the system to be scalable so new products can be added easily

# CHAPTER 8: SYSTEM DESIGN

## 8.1 User Flow Diagram

The user flow diagram maps the complete path a user follows through the application from initial access to final appointment confirmation:

The flow is entirely linear and sequential, minimising decision points and reducing cognitive load for the user. Each step naturally leads to the next, making the process intuitive even for first-time users.

## 8.2 Information Architecture

The information architecture defines the structural organisation of content across the application:

**Level 1 — Home Page:**
Application logo, welcome message, descriptive subtitle (Men Collection), and a single call-to-action button (Shop Now).

**Level 2 — Men Category Selection:**
Page title, multiple category cards (Shirts / T-Shirts / Jeans / Jackets / Accessories), each with image, category name, and short description.

**Level 3 — Product Listing Pages:**
Category heading, product cards displayed per page, each showing product image, product name, price, and short description.

**Level 4 — Product Details and Checkout Pages:**
Product profile header, detailed product description, size and color selection options, Add to Cart button, cart summary, checkout form with user details and payment options, and dynamic order confirmation details.

## 8.3 Low-Fidelity Wireframes (Paper Sketches)

Low-fidelity wireframes were created as paper sketches at the outset of the design process to rapidly explore layout options without investing time in visual detail. These sketches focused exclusively on the placement and hierarchy of interface elements.

**Home Page Wireframe:**
Header bar at the top spanning full width with brand logo. Banner section below the header centred horizontally displaying Men Collection. Single featured product card centred on the page with placeholder box for image, heading text, and description text. Footer bar at the bottom.

**Men Category Page Wireframe:**
Header and footer same as home page. Page title and subtitle centred below header. Multiple equal-width category cards arranged horizontally (Shirts, T-Shirts, Jeans, Jackets, Accessories). Each card with image placeholder, heading, and short description.

**Product Listing Wireframe:**
Header and footer consistent. Section heading. Two product cards side by side. Each card with image placeholder, product name, price, and short description.

**Product Details & Checkout Wireframe:**
Product information at top with large image placeholder. Product details below. Selection section with size and color options. Add to Cart button below. Cart summary table with product details. Checkout form with two columns — label column and input column — followed by Place Order button. Confirmation table below with order details.

---

## 8.4 Mid-Fidelity Wireframes (Digital)

Mid-fidelity digital wireframes were created to refine the layout and establish precise spacing, dimensions, and element relationships before applying visual styling. At this stage, actual product text was introduced but colours remained minimal.

Key decisions made during mid-fidelity wireframing included: fixed card width of 300px for home page and 280px for product cards; product images sized at 200x200px; form input width of 220px; cart and order table width of 90% of page width; and consistent 20px padding for all card elements.

---

## 8.5 Design System

A comprehensive design system was established to ensure visual consistency across all screens of the Men's Fashion Men E-Commerce Android Application. The design system defines the rules for colour, typography, components, and spacing, maintaining a premium and luxury brand identity.

---

### 8.5.1 Colors

| Color Name | Hex / RGB Value | Usage |
|---|---|---|
| **Primary Dark Black** | #000000 | Header background, toolbar, footer |
| **Luxury Gold** | #C5A46D | Buttons, highlights, icons, brand accents |
| **Light Cream** | #F8F5F0 | Page background colour — all screens |
| **Soft Grey** | #E5E5E5 | Card backgrounds, product sections |
| **Pure White** | #FFFFFF | Card background, text contrast areas |
| **Dark Grey** | #333333 | Default body text colour |
| **Accent Blue** | **#1A73E8** | **Links, clickable text, focus indicators** |

### 8.5.2 Typography

| Element | Font Family | Size / Weight | Usage |
|---|---|---|---|
| **Page Title (Toolbar)** | Sans Serif (Roboto) | 20sp / Bold | App title, screen headings |
| **Product Title** | Sans Serif (Roboto) | 18sp / Bold | Product name display |
| **Section Heading** | Sans Serif (Roboto) | 16sp / Bold | Category titles |
| **Body Text** | Sans Serif (Roboto) | 14sp / Normal | Product description, details |
| **Form Labels** | Sans Serif (Roboto) | 14sp / Medium | Input field labels |

| Element | Font Family | Size / Weight | Usage |
|---|---|---|---|
| **Button Text** | Sans Serif (Roboto) | 14sp / Bold | Add to Cart, Buy Now buttons |

### 8.5.3 Components

The design system defines the following reusable UI components:

**Card Component:**

• Background: Light theme (White / Light Purple)
• Padding: 16dp–20dp | Corner Radius: 10–12dp | Elevation for shadow effect
• Hover/Click State: Slight scale or ripple effect using Android ripple drawable
• Image Display: Full width for banners; circular (100–120dp) for profile images

**Toolbar (Header) Component:**

• Background: Primary color (#6200EE or custom theme color)
• Text: White, bold title aligned centre or left
• Includes navigation icon (menu/back button)

**Input Field Component:**

• Width: Match Parent | Padding: 8dp–12dp | Corner Radius: 6dp
• Background: White with outlined border
• Types used: text, email, number, password, date/time (via picker)

**Button Component:**

• Background: Primary color (#6200EE)
• Text Color: White | Padding: 10dp–16dp
• Corner Radius: 8dp | Click Effect: Ripple
• Disabled State: Light grey background

---

### 8.5.4 Spacing & Grid

The application uses a consistent spacing system based on multiples of 4dp and 8dp (Android standard).

Card padding is standardised at 16dp–20dp. Layout margins typically use 16dp. RecyclerView item spacing is maintained at 12dp–16dp. Screen sections use 24dp spacing. ConstraintLayout and LinearLayout are used to maintain alignment and responsiveness.

---

### 8.6 Accessibility Considerations

The Android application incorporates the following accessibility design considerations:

• Semantic Structure: Proper use of TextView, Button, EditText, and ImageView ensures structured UI.

• Content Descriptions: All images and icons include contentDescription for screen readers.

• Input Labels: Each input field is clearly labelled for better usability.
• Colour Contrast: Text and background colours ensure readability as per accessibility guidelines.

• Touch Targets: Buttons and interactive elements follow minimum 48dp touch size.

• Keyboard Support: Input fields support soft keyboard navigation properly.

• Feedback: Toasts, Snackbars, and visual cues provide feedback for user actions.

---

### 8.7 Prototype Design

The high-fidelity prototype of the Android application was developed using Java in Android Studio, representing the final implemented design. The prototype demonstrates all primary user flows such as login/registration, navigation between screens, data input, and output display.

The application is fully functional on Android devices. All activities and intents are properly connected, input fields capture user data, and dynamic features (such as lists using RecyclerView or Firebase integration) update in real time.

# CHAPTER 9: FINAL UI DESIGN

## 9.1 High-Fidelity Screen Designs

The following section presents the high-fidelity screen designs of all primary pages of Men's Fashion , accompanied by detailed design explanations.

**Figure 9.1 — Login Page:**

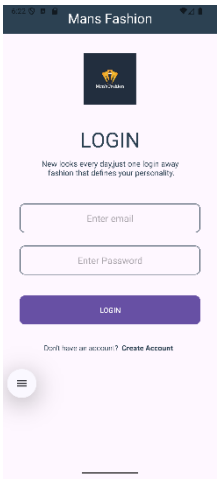

**Figure 9.2 — Category Page:**

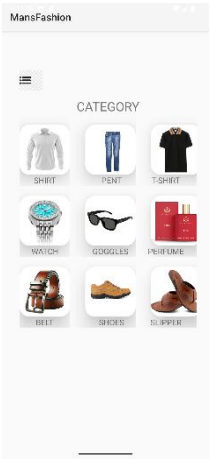

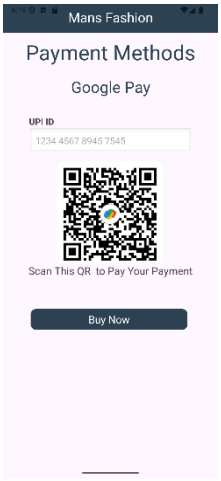

**Figure 9.3 —Product Page:**

**Figure 9.4 —Payment Methods:**

## 9.2 Screen-wise Design Explanation

Home Page Design Explanation:
The home page follows a clean and premium design approach inspired by fashion e-commerce applications. The header section displays the brand name "Men's Fashion" in a simple and elegant style, creating strong brand identity. The light beige background provides a soft and premium feel, aligning with luxury fashion aesthetics.

The layout is kept minimal to ensure focus on navigation. The use of simple typography and spacing enhances readability and provides a smooth user experience.

**Category Page Design Explanation:**

The category page displays multiple men's fashion categories such as Suits, Blazers, Shirts, T-Shirts, Trousers, and Coats. Each category is presented inside a card layout with rounded corners and subtle shadow, creating a modern and clean UI.

Images are placed at the top of each card to visually represent the category, followed by the category name below. The two-column grid layout ensures proper spacing and balance, making it easy for users to scan and select categories.

**Product Listing Page Design Explanation:**

The product listing page shows multiple shirt products arranged in a grid format. Each product card contains an image and product name, maintaining visual consistency across the application.

Uniform spacing, consistent card size, and aligned elements create a structured layout. The use of high-quality product images enhances user engagement and helps users make quick decisions.

**Payment Page Design Explanation:**

The payment page uses a simple and user-friendly layout. A clear heading "Payment Method" is displayed at the top, followed by multiple selectable options such as Cash on Delivery, Debit/Credit Card, and Online Payment.

Each option is presented inside a rounded rectangular container with proper spacing, making selection easy. The "Continue" button is prominently displayed at the bottom with a contrasting blue color, guiding the user toward the next step.

## 9.3 Prototyping & Interactions

The following interactive behaviours are implemented in the Android application:

• **Card Click Interaction**: All category and product cards are clickable using RecyclerView item listeners, allowing navigation between activities.

• **Navigation Interaction**: Clicking on a category opens the corresponding product listing screen using Android Intents**.**

• **Selection Interaction:** Users can select payment options using radio buttons, ensuring only one option is selected at a time.

• **Button Interaction:** The "Continue" button triggers navigation to the next screen or order confirmation using onClick listeners.

• **Dynamic Data Display**: Product data is displayed dynamically using RecyclerView adapters, ensuring smooth scrolling and efficient performance.

• **User Feedback:** Toast messages or visual feedback are shown for actions like selection or button clicks, improving user interaction.

# CHAPTER 10: IMPLEMENTATION & TOOLS

## 10.1 Tools & Technologies

| Tool / Technology | Version / Type | Purpose in Project |
|---|---|---|
| Java | JDK 8+ | Core programming language used for Android application development |
| Android Studio | Latest Version | Primary IDE for designing, coding, and testing the application |
| XML | Android XML Layout | UI design, layouts, and component structuring |
| Android SDK | Latest Version | Provides tools, libraries, and APIs for Android development |
| RecyclerView | Android Component | Efficient display of product lists in grid format |
| ConstraintLayout | Android Layout | Flexible and responsive UI design |
| Glide / Picasso (Optional) | Image Library | Loading and displaying product images efficiently |
| Material Design Components | UI Library | Buttons, cards, input fields, and modern UI elements |
| Emulator / Android Device | Android OS | Testing and running the application |
| Intent API | Android Native | Navigation between activities/screens |

## 10.2 Design System Implementation (Java)

The design system components defined in Chapter 8.5 were implemented consistently across all screens using Android XML and Java code. The following describes the implementation of each key component:

**Card Component Implementation:**
Product and category cards were implemented using CardView in XML. Properties such as corner radius, elevation (shadow), and padding were applied to maintain consistency. Images and text were placed inside the card using ImageView and TextView. RecyclerView adapters were used to dynamically populate cards.

**Header (Toolbar) Implementation:**
The header was implemented using Toolbar or default ActionBar. The title was set programmatically in Java for each activity. Background color and text color were styled using themes and styles.xml.

**Input Field Implementation:**
Input fields were implemented using EditText with proper input types (text, email, number). Styling such as padding, background, and borders were defined in XML drawable resources.

**Button Implementation:**
Buttons such as "Continue" were implemented using Button or MaterialButton. Click events were handled using setOnClickListener() in Java. Ripple effects and rounded corners were added using drawable resources.

**RecyclerView Implementation:**
RecyclerView was used to display product lists efficiently. A custom adapter class was created to bind product data to item layouts. GridLayoutManager was used for displaying items in a two-column grid format.

**Navigation Implementation:**
Screen navigation was handled using Intents. Clicking on a category or product triggers navigation to the respective activity using startActivity().

# CHAPTER 11: USABILITY TESTING & ITERATION

## 11.1 Usability Testing Method

Usability testing was conducted using a moderated think-aloud protocol. Five representative users from the target audience (online shoppers) were selected to participate. Each participant was asked to complete specific tasks using the Men's Fashion (Men Only) application while verbally describing their thought process, observations, and any confusion encountered.

The testing sessions were conducted in an informal setting using an Android smartphone. A facilitator observed each session and recorded notes on task completion rates, time taken, user errors, and feedback. A short usability questionnaire was administered after testing to gather user satisfaction data.

## 11.2 Testing Scenarios & Tasks

**The following tasks were assigned to each test participant:**

**Task 1 — Category Navigation:**
'You want to buy a formal outfit. Please navigate to the appropriate category (e.g., Suits or Blazers).'

**Task 2 — Product Browsing:**
'Browse the available products in the selected category and choose a product you like.

**Task 3 — Product Selection:**
'Select a product and proceed towards purchase.'

**Task 4 — Payment Selection:**
'Choose your preferred payment method from the available options.'

**Task 5 — Order Completion:**
'Complete the process and confirm your order selection.'

## 11.3 User Feedback Analysis

**Positive Feedback:**

• All five participants successfully completed all tasks without assistance, indicating a 100% task completion rate.
• Four participants found the category and product navigation "easy and intuitive."
• Users appreciated the clean UI design and clear product images.
• Payment options were clearly visible and easy to select.

Areas for Improvement:

• Two participants expected a "Back" button on the payment page.
• One participant suggested adding product price details on listing cards.
• Two users wanted a cart page before payment for better review.
• One participant was unsure if the order was successfully placed due to lack of confirmation screen.

## 11.4 Iterative Design (Before vs. After Comparison)

| Issue | Before (Initial Design) | After (Improved Design) |
|---|---|---|
| **Navigation** | No back button on payment page | Back button added for easy navigation |
| **Product Info** | Limited product details | Added price and better descriptions |
| **Cart System** | Direct payment without review | Cart page added before checkout |
| **Confirmation** | No clear confirmation screen | Order confirmation screen added |
| **UI Feedback** | Limited interaction feedback | Toast messages and visual feedback added |

# CHAPTER 12: CONCLUSION & FUTURE SCOPE

## 12.1 Advantages of the Project

### 12.1.1 User-Friendly Interface:

The application follows a simple and clean design approach, making it easy for users to browse categories, view products, and complete purchases without confusion.

### 12.1.2 Mobile Accessibility:

As an Android application, users can access the platform anytime and anywhere, providing convenience compared to traditional shopping methods.

### 12.1.3 Structured Navigation Flow:

The step-by-step flow from category → product → payment ensures a smooth and guided shopping experience.

### 12.1.4 Consistent Design System:

The use of consistent colours, layouts, and components creates a professional and visually appealing interface.

### 12.1.5 Fast Performance:

The use of RecyclerView and optimized layouts ensures smooth scrolling and fast performance.

### 12.1.6 Cost-Effective Development:

The project is developed using Java and Android Studio, making it cost-effective and accessible for learning and implementation.

## 12.2 Limitations of the Project

### 12.2.1 No Backend Integration:

The application does not store data permanently. All data is static or temporary.

### 12.2.2 No User Authentication:

There is no login or user account system implemented.

### 12.2.3 Limited Product Categories:

Only men's categories are included in the current version.

### 12.2.4 No Real Payment Gateway:

Payment options are only simulated and not integrated with real payment systems.

### 12.2.5 No Order History:
Users cannot view previous orders or track purchases.

---

## 12.3 Future Enhancements

### 12.3.1 Backend Integration:
Integration with Firebase or a backend server to store user data, orders, and products.

### 12.3.2 User Authentication:
Add login and registration system for personalized experience.

### 12.3.3 Shopping Cart System:
Implement a full cart system with add/remove product functionality.

### 12.3.4 Payment Gateway Integration:
Integrate real payment systems like UPI, cards, or wallets.

### 12.3.5 Push Notifications:
Send notifications for order confirmation and offers.

### 12.3.6 Multi-Category Expansion:
Add Women and Kids categories to expand the application.

---

# CHAPTER 13: REFERENCE

**Men's Fashion Official Website:**
**Link: https://www.ralphlauren.com/**

---

# CHAPTER 14: APPENDICES

---

## Appendix A — Additional Screens
**This appendix contains additional screens of the Men's Fashion Android application including Category Page, Product Listing Page, and Payment Page. All main screens have been documented in Chapter 9.**

---

## Appendix B — Additional Wireframes
The wireframes were developed in low-fidelity and mid-fidelity stages. Initial sketches defined layout structure, while digital wireframes refined spacing, alignment, and hierarchy.

Key decisions included using a grid layout for product display, card-based UI for categories, and a simple checkout flow.

---

## Appendix C — Survey Questionnaire

23. How do you usually shop for clothes? (Online / Offline / Both)
24. How satisfied are you with online shopping apps? (1–5 scale)
25. What factors influence your purchase decision? (Price / Brand / Design / Reviews)
26. How important are product images for you? (1–5 scale)
27. Do you prefer simple checkout without login? (Yes / No / Maybe)
28. How important is quick payment process? (1–5 scale)
29. Which device do you use most for shopping? (Mobile / Laptop / Tablet)
30. What improvements would you like in shopping apps? (Open-ended)
